Laser-assisted bioprinting (LAB) is an emerging technology in the field of tissue engineering. Its physical mechanism makes it possible to print cells and liquid materials with a cell-level resolution. By giving tissue engineers control over cell density and organization of 3D tissue constructs, LAB holds much promise for fabricating living tissues with physiological functionality. After introducing the rationale of applying LAB to tissue engineering, we present exhaustively the physical parameters related to the laser-induced forward transfer technique (LIFT), which is implemented in LAB. These parameters are critical to controlling the cell printing process and must work together to print viable cell patterns with respect to cell-level histological organization and to high-throughput manufacturing. After describing the experimental requirements that should be considered to fabricate 3D tissues by LAB, we present some of the main breakthroughs, including multicomponent printing, 3D printing approaches, and bioprinting in vivo that may serve in tissue engineering and regenerative medicine.

From reader reviews:

Jules Thompson:

Hey guys, do you want to find a new book to learn? Maybe the book with the subject Biofabrication: Chapter 6. Laser-Assisted Bioprinting for Tissue Engineering (Micro and Nano Technologies) suitable to you? Typically the book was written by a popular writer in this era. Typically the book titled Biofabrication: Chapter 6. Laser-Assisted Bioprinting for Tissue Engineering (Micro and Nano Technologies) is one of several books in which everyone reads now. This specific book was inspired a number of people in the world. When you read this review you will enter the new dimension that you never knew just before. The author explained their idea in a simple way, so all of people can easily understand the core of this publication. This book will give you a large amount of information about this world now. To help you to see the represented of the world on this book.

Bruce Bracey:

The publication titled Biofabrication: Chapter 6. Laser-Assisted Bioprinting for Tissue Engineering (Micro and Nano Technologies) is the book that recommended to you to see. You can see the quality of the publication content that will be shown to a person. The language that publisher use to explain their ideas are easily to understand. The author did a lot of exploration when write the book, hence the information that they share to you personally is absolutely accurate. You also might get the e-book of Biofabrication: Chapter 6. Laser-Assisted Bioprinting for Tissue Engineering (Micro and Nano Technologies) from the publisher to make you more enjoy free time.

Sandra Phillips:

Is it anyone who having spare time after that spend it whole day simply by watching television programs or just laying on the bed? Do you need something totally new? This Biofabrication: Chapter 6. Laser-Assisted Bioprinting for Tissue Engineering (Micro and Nano Technologies) can be the respond to, oh how comes? A book you know. You are therefore out of date, spending your free time by reading in this fresh era is common not a nerd activity. So what these books have than the others?

Kenneth Leishman:

Reading a review make you to get more knowledge from this. You can take knowledge and information from your book. Book is composed or printed or outlined from each source that will filled update of news. Within this modern era like currently, many ways to get information are available for a person. From media social just like newspaper, magazines, science book, encyclopedia, reference book, fresh and comic. You can add your knowledge by that book. Are you hip to spend your spare time to open your book? Or just looking for the Biofabrication: Chapter 6. Laser-Assisted Bioprinting for Tissue Engineering (Micro and Nano

Technologies) when you needed it?
