Photosynthesis: Physiology and Metabolism (Advances in Photosynthesis and Respiration) Richard C. Leegood

The principal aim of *Photosynthesis: Physiology and Metabolism* is to provide final year undergraduates, graduate students and researchers with an up-to-date and comprehensive overview of photosynthetic carbon metabolism in plants, ranging from molecular to ecophysiological aspects. The book examines how CO₂ is acquired by algae and by plants and is divided into three sections. The first section concentrates on the pathways (the Calvin-Benson-Bassham cycle and photorespiration, with particular emphasis on the enzyme ribulose biphosphate carboxylase/oxygenase, Rubisco) and the regulation of CO₂ fixation. The second section deals with the fate of fixed carbon, in chapters on the synthesis of products, such as sucrose, starch, fructans and sugar alcohols, and with the regulation of cellular partitioning of carbon, including topics such as respiration and feedback regulation of photosynthesis by carbohydrates. The last section concentrates on the various problems that plants face in taking up CO₂ from their environment, and how CO₂ concentrating mechanisms operate in the algae and in plants with C₄ photosynthesis and Crassulacean Acid Metabolism. The ecological significance of these mechanisms is also discussed.
